ABSTRACTED-PUB-NO: JP2000139471A

BASIC-ABSTRACT:

NOVELTY - Preparing L-methionine (Met) with a modified Met producing microorganism, is new.

DETAILED DESCRIPTION - A microorganism, particularly belonging to Escherichia sp., deleted for a repressor of the Met biosynthetic system and capable of producing Met, particularly with enhanced homoserine transsuccinylase activity, optionally with attenuated intracellular S-adenosyl methionine synthetase (SAM), optionally released of concerted inhibition with Met and S-adenosylmethionine, and especially demanding L-threonine, is used for preparation of Met.

An INDEPENDENT CLAIM is also included for a DNA encoding a homoserine transsuccinylase having a variation in a sequence of 309 amino acids with replacement of Arg27 to Cys; Ile296 to Ser; Pro298 to Leu; Arg27 to Cys and Ile296 to Ser; Ile296 to Ser and Pro298 to Leu; Pro298 to Leu and Arg27 to Cys; or Arg27 to Cys, Ile296 to Ser and Pro298 to Leu.

USE - The method is used for the preparation of L-methionine (Met).

ADVANTAGE - A variant metA gene releases concerted inhibition with Met and SAM and can be used for culturing a Met producing microorganism.
